L89.623 - Stage 3
L89.624 - Stage 4
L89.626 Pressure-induced deep tissue damage
L89.629 Unspecified stage

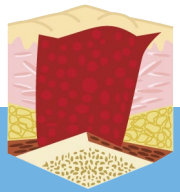

STAGE 1
Intact skin with non-blanchable redness of a localized area, usually over a bony prominence.

STAGE 2
Partial thickness loss of dermis presenting as a shallow open ulcer with a red/pink wound bed, without slough. May also present as an intact or open/ruptured serum-filled or serosanguineous filled blister.

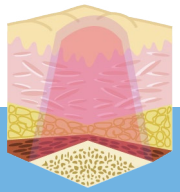

STAGE 3
Full thickness tissue loss. Subcutaneous fat may be visible, but bone, tendon, or muscle are not exposed. Some slough may be present. May include undermining and tunneling.

STAGE 4
Full thickness tissue loss with exposed bone, tendon, or muscle. Slough or eschar may be present. Often include undermining and tunneling.

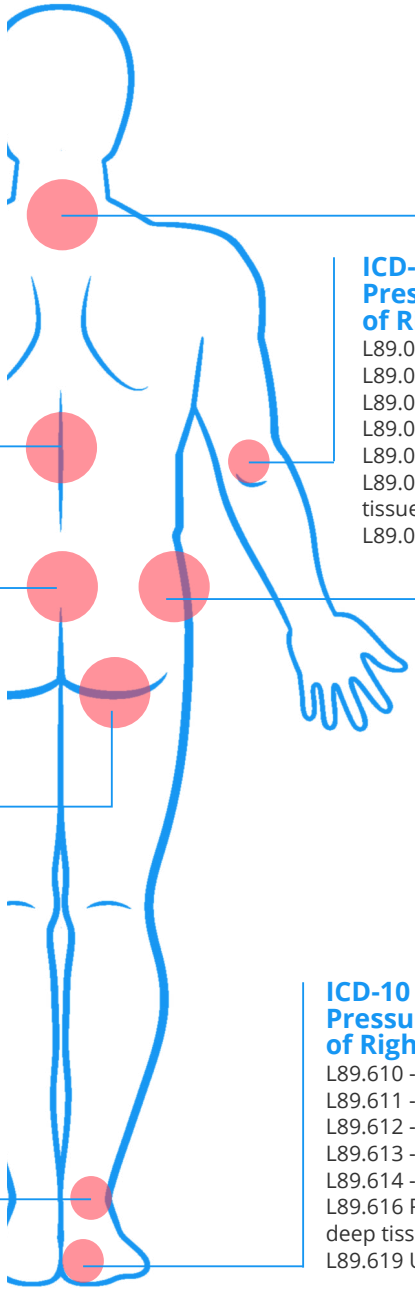

UNSTAGEABLE
Full thickness tissue loss in which actual depth of the ulcer is completely obscured by slough (yellow, tan, gray, green, or brown) and/or eschar (tan, brown, or black) in the wound bed.

SUSPECTED DEEP TISSUE INJURY
Purple or maroon localized area of discolored intact skin or blood-filled blister due to damage of underlying soft tissue from pressure and/or shear.
